## Profile

Built scalable solutions across civic tech, fintech, and AI domains, with projects recognized at national-level hackathons (SIH 2025 semi-finals, Hack4Impact 3rd Place). Strong in DSA, REST API development, and AWS, with hands-on experience in ETL pipelines, workflow automation, and system design.

Actively seeking Software Development Engineer (SDE) internship or full-time roles to build high-impact, production-grade software systems. Final-year B.Tech CSE student at Kalinga Institute of Industrial Technology (KIIT) (2027 batch) with experience building AI automation systems, full-stack applications, and LLM-powered pipelines. Currently an SDE Intern at Soshals, where I have shipped 3+ production-grade systems, reducing manual effort by 80%.

Built scalable solutions across civic tech, fintech, and AI domains, with projects recognized at national-level hackathons (SIH 2025 semi-finals, Hack4Impact 3rd Place). Strong in DSA, REST API development, and AWS, with hands-on experience in ETL pipelines, workflow automation, and system design.

Actively seeking Software Development Engineer (SDE) internship or full-time roles to build high-impact, production-grade software systems.

## Education

**Kalinga Institute of Industrial Technology** 2023 – 2027

B.Tech in Computer Science and Engineering

**Maharishi Vidya Mandir** 2020 – 2022

Higher Secondary Education (83.4%)

**Holy Cross H.S School** 2020

Secondary Education (90.5%)

## Experience

• **SDE Intern — Soshals** 2026

Engineered scalable automation infrastructure using LLM APIs, n8n, and Google Apps Script to streamline creator operations and outreach workflows. Designed and deployed 3+ production-grade systems including automated content pipelines, lead tracking systems, and duplicate detection mechanisms, reducing manual operational effort by 80%. Built a Chrome Extension integrated with Google Sheets for real-time data capture, unique ID assignment, and centralized tracking. Improved system reliability by implementing error handling, retry logic, and workflow monitoring across automation pipelines.

• **USC.KIIT – UiPath Student Community** 2025 – Present

Active member of UiPath-powered student community endorsed by KIIT T&P Cell, contributing to real-world automation and data analytics projects. Developed automation workflows using UiPath and Python for data extraction, transformation, and reporting. Collaborated in team-based projects to analyze datasets and generate actionable insights, improving decision-making processes. Gained hands-on experience in RPA tools, workflow optimization, and integrating APIs for end-to-end automation solutions.

• **AICTE Virtual Internship – Data Engineering with AWS** 2025

Completed intensive hands-on training in AWS Data Engineering, focusing on building scalable and efficient data pipelines. Designed ETL workflows using AWS services such as S3, Lambda, and Glue for data ingestion, processing, and storage. Implemented cloud-based data architectures to handle structured and semi-structured data. Developed an understanding of distributed systems, data lake design, and best practices for cloud data processing and pipeline optimization.

## Projects

• **Reddit Scraper → AI Video Generator** (Python, Reddit API, LLM APIs, Arcads) GitHub

- Engineered an end-to-end asynchronous content pipeline ingesting 500+ Reddit posts/day with signal-based filtering (upvote ratio  $\geq 85\%$ , comment velocity thresholds), eliminating 100% manual content sourcing
- Architected a 4-stage ETL workflow — data ingestion → NLP filtering → LLM prompt chaining → AI video synthesis — slashing content turnaround time from 3 hours to under 8 minutes (94% reduction)
- Orchestrated LLM-based scriptwriting module with dynamic prompt templating, generating platform-optimized scripts across 3 content formats (Reels, Shorts, TikTok) with zero human intervention

• **Creator Outreach Automation System** (JavaScript, Google Apps Script, Google Sheets) GitHub

- Architected a 3-tier full-stack system — Chrome Extension (Manifest V3) frontend → Apps Script REST backend → Sheets as live relational DB — enabling one-click creator capture from any webpage in under 2 seconds
- Engineered a real-time bidirectional sync engine with Scout ID-based deduplication and conflict resolution logic, maintaining zero duplicate records across a pipeline of 200+ creators
- Automated end-to-end outreach workflow — capture → dedup → status tagging → follow-up trigger — reducing per-creator CRM processing time from 4 minutes to 18 seconds (85% reduction)
- **AI UGC Content Engine** (*LLM APIs, n8n, Google Sheets*) GitHub
  - Developed a scalable LLM orchestration system with a 4-layer prompt architecture (persona → platform → format → tone), generating 150+ structured UGC content briefs per session across 5+ brand verticals
  - Designed role-conditioned prompt templates improving output specificity by 3x over baseline zero-shot prompting, validated across 10+ content categories
  - Delivered JSON-structured output pipelines directly ingestible by downstream tools, compressing creator ideation-to-execution latency from 48 hours to under 15 minutes (95% reduction)
- **NagarMitra – Civic Issue Tracker** (*React Native, Node.js, AWS*) GitHub
  - Developed a full-stack geospatial civic platform with GPS-tagged issue submission, real-time status tracking, and ward-wise heatmap visualizations spanning 10+ civic complaint categories
  - Integrated Mitra AI — an LLM-powered classification microservice — to auto-categorize and route civic complaints with ~88% accuracy, reducing manual triage effort by 70% across 500+ reported issues
  - Deployed multi-channel reporting interface (React Native app + Telegram bot) on AWS with horizontally scalable REST API architecture; awarded **3rd Place at Hack4Impact Track, SDIS 2026**
- **PashuMitra — AI Animal Welfare Platform** (*React, Node.js, Python, AWS, NLP*) GitHub
  - Engineered a multilingual AI platform supporting 26+ Indian languages, enabling livestock monitoring and accessibility for rural users with low technical literacy
  - Developed real-time disease detection and alert system integrated with an LLM-powered chatbot, achieving response latency under 3 seconds via optimized API orchestration
  - Designed scalable backend workflows for health tracking and reporting; advanced to Smart India Hackathon 2025 semi-finals among 550+ teams
- **Spendora — Personal Finance Tracker** (*React, MySQL, Data Visualization*) GitHub
  - Built a full-stack finance platform with rule-based expense classification across 8 categories, achieving 99% accuracy on transaction data
  - Implemented interactive dashboards with trend analysis, anomaly detection, and budget insights, enabling users to derive financial insights in under 30 seconds
  - Optimized relational database queries using indexing and normalization, achieving sub-100ms latency across 1,000+ transaction records
- **Studifyy — AI Productivity Platform** (*React, GenAI, RAG, APIs*) GitHub
  - Developed a modular productivity SaaS platform integrating tasks, goals, deadlines, and study workflows into a unified system architecture
  - Engineered a goal-tracking and analytics engine with real-time updates (<5 seconds) and adaptive scoring for productivity optimization
  - Designed a component-based React frontend achieving consistent sub-200ms UI response times across core user interactions

## Achievements

- **Smart India Hackathon (SIH) 2025 — PashuMitra** PashuMitra  
Secured **2nd position** among 550+ teams in the internal round and advanced to national semi-finals (Problem Statement SIH25006). Designed and presented an AI-driven livestock health platform with multilingual NLP support, real-time disease detection, and alert systems; evaluated by a national-level technical jury for scalability, impact, and system design.
- **Student Developer & Innovation Summit (SDIS) 2026**  
Secured **3rd Place (Hack4Impact Track)** for developing **NagarMitra**, a full-stack civic platform with GPS-based reporting, real-time dashboards, heatmap analytics, and LLM-powered issue classification, improving transparency and efficiency in urban issue management workflows.
- **Pandora's Paradox Hackathon — KIIT E-Summit 2025** Spendora  
Awarded **Special Team Recognition** for building a full-stack finance platform with automated expense classification, real-time analytics dashboards, and data-driven financial insights under industry mentorship.

- **45 Days CodeSprint — USC.KIIT & UiPath 2025**

Ranked **Top 30** among 1,000+ participants in a competitive coding and automation sprint.

- **Google × Kaggle GenAI Program 2025 — Studifyy**

GitHub

Completed an intensive GenAI Agents program, earned certification, and built a production-grade multi-agent learning platform using LLMs and RAG pipelines.

## **Certifications**

---

- **Google Cloud (Generative AI):** Generative AI Learning Path, Large Language Models, Responsible AI, AI Principles [Verify]
- **AWS:** Data Engineering, Cloud Foundations, Solution Architecture (Forage) [Verify]
- **UiPath (Automation):** Agentic Automation, CodeSprint (Top 30 Recognition) [Verify]
- **Google × Kaggle:** GenAI Agents Program [Verify]
- **Infosys Springboard:** Python Foundation, Soft Skills [Verify]
